Ileostomy Diet Guidelines

An ileostomy is a surgical opening in the abdomen in which the end of the small intestine (ileum) is brought to the skin surface. The opening in the ileum at the skin is called a stoma. The stoma becomes the exit for all stool and gas. It must be covered with an ileostomy bag to collect the output.

Eating after an ileostomy

An ileostomy affects the way your body digests and absorbs nutrients. Follow the instructions in this handout to get the nutrition you need while preventing diarrhea, high stool output, unpleasant odors, gas or an ileostomy blockage.

General guidelines

- Follow a low-fiber diet for at least 6 weeks after your surgery (Table 3). Foods that are high in fiber are difficult to digest and can increase your chances of having unpleasant symptoms.
- Eat small amounts of food every 2 to 4 hours (4 to 6 small meals or snacks daily instead of 3 large meals).
- Avoid eating large amounts of food in the evening to help decrease your stool output throughout the night. Eat your largest meal during the middle of the day.

What you can do

To prevent blockage

- Eat slowly and chew foods thoroughly.
- Limit fiber. Choose foods with less than 2 grams of fiber per serving.
- Be careful when you eat foods that may cause blockages (Table 1). Eat only small amounts of these foods.

To prevent diarrhea and high stool output

- Limit fiber. Choose foods with less than 2 grams of fiber per serving.
- Eat on a similar schedule every day. Do not skip meals. This can cause your intestines to be more active, increasing gas and watery stool.
- Avoid drinking fluids during meals and snacks and for 30 minutes after eating.
- Eat foods that help thicken your stool several times a day (Table 1).
- Avoid acidic, spicy, fried and greasy foods.
- Avoid beverages or foods high in sugar and artificial sweeteners.
- Dilute fruit juice or other sweet drinks by adding an equal amount of water.
- Avoid beverages and foods containing sugar alcohols (erythritol, sorbitol, mannitol and xylitol).
- Limit caffeine and alcohol.
- If you feel unwell after eating dairy foods, try lactose-free dairy products.

**To reduce gas and prevent unpleasant odors**
Your body will release gas about 2 to 4 hours after eating gas-producing foods. To reduce gas and odor:

- Eat on a similar schedule every day. Do not skip meals. This can cause your intestines to be more active, increasing gas and watery stool.
- Avoid chewing gum, drinking with straws, drinking carbonated beverages, smoking or chewing tobacco, and eating too fast.

**To prevent weight loss that does not happen on purpose**

- Try eating high-calorie and high-protein snacks. Examples include:
  - 5 saltine crackers with 2 ounces of cheddar cheese (provides about 290 calories and 15 grams of protein)
  - 4 graham cracker squares with 2 tablespoons of peanut butter (provides about 250 calories and 9 grams of protein)
- Try BOOST Glucose Control®, Ensure® High Protein, or Ensure® Max Protein shakes. However, avoid high-sugar supplements such as Ensure® Plus or BOOST Plus® because they may increase your ileostomy output.
- You may add protein powders to foods and beverages to add calories and protein.

**To add vitamins and minerals to your diet**

- Take a chewable (non-gummy) multivitamin with minerals daily for best absorption.
- Take a chewable or liquid calcium supplement. Liquid calcium citrate is best absorbed by your body and can be taken with or without food.

**To add foods back into your diet**

- Starting 6 weeks after surgery, add 1 new fiber-rich food every few days to allow your body to get used to eating fiber. Start with foods that you were able to eat without problems before surgery.
- Some foods may cause symptoms such as gas, odor or diarrhea. It is best to keep a list of foods that cause these symptoms. If a certain food gives you symptoms, avoid it for 2 to 3 weeks. Then, try it again in small amounts to see how your body reacts.
- Continue to use caution when eating foods that may cause blockages (Table 1).
Table 1. Food recommendations after your ileostomy

| Foods that may help thicken loose output | Applesauce, bananas, white rice, cheese, marshmallows, saltine crackers, tapioca, creamy peanut butter, skinless potatoes, pretzels, cream of wheat, pasta, white bread, yogurt |
| Foods that may cause diarrhea | Alcohol, apricots, beans, bran, broccoli, Brussels sprouts, cabbage, chocolate, corn, fried foods, plums, soup, spicy foods, sugar-free gum, high-fat foods, high-sugar foods, licorice, dairy foods, nuts and seeds, peaches, peas, prunes, caffeinated drinks, fruit, fruit juice, sugar substitutes, tomatoes, raw leafy green vegetables, whole grains |
| Foods that can cause blockages | Unpeeled apples, bean sprouts, raw cabbage, sausage casing, celery, coconut, coleslaw, corn, cucumbers, dried fruit, grapes, green peppers, mushrooms, nuts, peas, pickles, pineapple, popcorn, relishes and olives, salad greens, seeds and nuts, spinach, vegetable and fruit skins, whole grains, tough meats |
| Foods and fluids that cause gas or odor | Alcohol, apples, asparagus, bananas, broccoli, Brussels sprouts, cabbage, carbonated beverages, beer, cauliflower, cheese, corn, cucumbers, dairy, dried beans and peas, eggs, fatty foods, fish, grapes, green peppers, melons, onions, peanuts, prunes, radishes, turnips |
| Foods that may lessen gas or odor | Buttermilk, yogurt, cranberry juice, parsley |
| Foods that may discolor stool | Beets, foods with red food dye, asparagus, broccoli, spinach |
| Foods that my help replace lost electrolytes (essential minerals your body needs) | Bananas, broths, potatoes, tomatoes, crackers, sports drinks, homemade rehydration drinks (Table 2) |

Dehydration

Dehydration occurs when your body loses more fluid than it is taking in. This can cause serious complications in the way your body functions. If you have high volumes of stool output from your ileostomy, if you are vomiting or if you do not drink enough fluid, you may be at risk for dehydration. Stoma output of more than 1 liter (or 1,000 milliliters) per day is considered high output. If this occurs for more than 24 hours, be sure to:

- Avoid foods that may be causing diarrhea
- Eat more foods that may help slow or thicken output (Table 1)
- Contact your healthcare provider
Symptoms of dehydration

- Thirst
- Dizziness when standing up
- Dry mouth
- Fatigue
- Decreased urine output
- Muscle or abdominal cramps
- Dark-colored urine

Keep well hydrated
You will probably need more fluids than most people, especially if you increase your activity or sweat.

Try these tips:

- Drink a minimum of 8 to 10 cups of liquids per day.
- Sip on liquids throughout the day.
- Try to remember to drink a glass of liquid whenever you empty your pouch.
- Try rehydration drinks, especially if you have high stool output.

Try the following drink mixes:
- Pedialyte AdvancedCare® Plus
- Ensure® Rapid Hydration
- DripDrop® ORS
- Ceralyte® 70
- Avoid sport drinks with sugar or sugar-free sweeteners because these may increase your ileostomy output.
- Use the recipes in Table 2 to make your own rehydration drinks.
